

Casbon (C.I. 15196) is a 6-rowed awned feed barley developed from a cross between Cascade and Bonneville. It was developed for Western Oregon by the Oregon AES. Casbon is a stiff strawed, winter, mid-tall, late variety. The kernels are blue, mid-long to long. In yields Casbon has an average of 10 to 15 percent higher than the commercially grown varieties. Foundation seed was distributed in the fall of 1969.
