2.5% MA Gollnick

2.5% KM Murphy

2% JW Burns

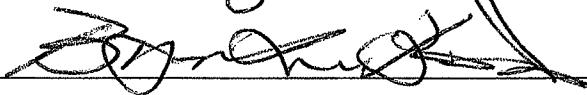

2% TD Murray

2% XM Chen

1% BK Baik

1% K Garland Campbell

1% B Goates

# Proposal for Final Release of SWW ‘Xerpha’

## A. General situation

1. **Need for cultivar:** Madsen and Eltan have been the predominant soft white common winter cultivars in Washington for over a decade. Xerpha is adapted to a broad range of production areas and consistently ranks among the top cultivars in all agronomic categories. When compared to Madsen, Eltan, and Tubbs, extensive data indicate that Xerpha is equal or superior in grain yield (Table 1-7), cold tolerance (Table 9), end-use quality (see WWQL summary), and resistance to various diseases (Tables 14-17). Xerpha will have a strong positive impact on the production of soft white winter wheat grown in Washington.
2. **Use type:** Soft white common winter wheat. FGIS grain grading results for samples collected from the 2005 and 2006 WSU Variety Testing trials grade Xerpha as soft white (Table 8).
3. **Description:** Semi dwarf, soft white wheat with mid-season maturity, common head type, awns, white straw and white glumes.
4. **Intention:** General varietal improvement. Xerpha is targeted to replace Eltan and Madsen in all rainfall zones as it consistently produces higher grain yields.

## B. Identification

1. **Selection No's:** SSD01061, WA007973
2. **Proposed Name:** Xerpha
3. **Pedigree:** Eltan/Estica

## C. General Agronomics

1. **Agronomic evaluations:** Xerpha has been evaluated in field trials since 2001. Grain yields of Xerpha, were generally greater than Madsen and Eltan, and equal to or greater than Tubbs, across all precipitation zones. Specifically, the mean yield from 55 WSU Variety Testing yield trials in 2005 through 2007 of Xerpha, Madsen, Eltan and Tubbs were 110.9, 102.2 and 97.8 and 110.9 bushels/acre, respectively (Table 5). Xerpha also performed well in 2007 Oregon, Idaho and California variety testing trials (Tables 6a-6c).
2. **Other agronomic traits:**

- a. **Test Weight:** Grain volume weight in general indicate that Xerpha is equal to Madsen and Eltan, and 0.7 lbs/bu heavier than Tubbs (Tables 1-5).
  - b. **Grain Protein Content:** Grain protein concentrations of Xerpha tend to be equal to Eltan and Tubbs, and 0.6 % less than Madsen (Tables 1-5).
  - c. **Plant Height:** Xerpha, Madsen, Eltan and Tubbs are similar in plant height (1-2" difference) within each precipitation zone (Table 11).
  - d. **Seedling Emergence/Coleoptile:** Xerpha generally has a coleoptile length and emergence capabilities similar to Eltan (Table 10).
  - e. **Cold Tolerance:** Cold tolerance tests conducted by Dr. K. Garland Campbell indicate Xerpha is slightly more cold tolerant than Tubbs and Madsen, and similar to Eltan (Table 9).
  - f. **Maturity:** Xerpha matures approximately 2 days earlier than Eltan, similar to Madsen, and 2 days later than Tubbs (Table 12).
  - g. **Lodging:** Xerpha resists lodging slightly less than Tubbs, but significantly better than Eltan (Table 13).
3. **Quality:** See assessment of the quality of Xerpha by Dr. B. Baik and the USDA-ARS Western Wheat Quality Lab.
4. **Resistance to disease:**
- a. **Stripe Rust:** As reported by Dr X. Chen, Xerpha has durable high-temperature, adult-plant resistance to stripe rust (caused by *Puccinia striiformis* Westend.). (Table 14).
  - b. **Leaf Rust:** Not tested (caused by *Puccinia triticina* Eriks: syn *Puccinia recondita* Roberge ex Desmaz. f. sp. *tritici* Eriks. and E. Henn.).
  - c. **Stem Rust:** Not tested (caused by *Puccinia graminis* Pers.:Pers.).
  - d. **Cephalosporium Stripe:** Dr T. Murray reported that in inoculated field trials (Table 15) Xerpha is tolerant of Cephalosporium stripe (caused by *Cephalosporium gramineum* Nis. & Ika), comparable to Eltan and Bruehl, the most tolerant commercial varieties in Washington. Under sever Cephalosporium stripe pressure, yield of Xerpha was similar to Eltan and Bruehl, but greater than Madsen (Table 15).

- e. **Foot Rot:** Inoculated field evaluations show Xerpha had an elevated disease index level, but little yield effect from eyespot foot rot (caused by *Tapesia yellundae* Wallwork and Spooner). See inoculated field results by Dr. T. Murray (Table 16).
  - f. **Speckled Snow Mold:** Xerpha was tested under severe natural field infections of speckled snow mold (caused by *Typhula idahoensis* Rems and *T. ishikariensis* Imai.) in 2005/06 and moderate levels in 2006/07 (Table 17). Dr T. Murray's results indicate its tolerance is significantly better than Madsen and Tubbs, but less than Eltan.
  - g. **Dwarf Bunt:** Xerpha tested similar to Madsen for dwarf bunt (caused by *Tilletia controversa* Kühn) in Dr. B. Goates inoculated field trials.
5. **Area of Adaptation:** Xerpha appears to have a broad range of adaptation. It has emerged and yielded well for semi dwarf soft white common varieties under deep-furrow seeding with very dry conditions. It also has performed very well in the intermediate and high precipitation zones. Xerpha may be best suited to replace Eltan in areas south of Highway 2 where snow mold is generally not a problem.
6. **Weaknesses:** Xerpha has not had a strong field winter hardiness test.
- D. **Seed Source, Status, and Availability:** Washington State Crop Improvement Association planted one acre of head rows of Xerpha on Oct. 19, 2006 near Othello, WA. Breeder's seed of Xerpha will be increased in the 2006/07 crop year. Foundation seed should be available for fall, 2008.
- E. **Other Comments:** This release request is based on Xerpha's general varietal improvement, broad adaptability, and overall yield stability exceeding the other predominant soft white common winter wheats grown in Washington State.
- F. **Probable Date for Possible Release:** 2008.
- G. **Provisions for PVP:** The PVP application will be submitted when approved for full release.

**Table 1.** Mean grain yield (bu/a), test weight (lbs/bu) and grain protein content (%) of Xerpha, Eltan, Madsen and Tubbs in the 2005-2007 WSU Extension Uniform Cereal Variety Testing winter wheat variety performance trials with 7-14" annual precipitation.

### **INTRODUCTION**

Following is an assessment of the quality of **Xerpha**. Assessment of wheat quality involves in-depth knowledge of industry needs, technical knowledge of testing methodologies and the traits that they measure, and an understanding of statistical analyses and their appropriate interpretation. Conclusions may therefore vary accordingly. Data are from the USDA ARS Western Wheat Quality Laboratory and the Washington State University Wheat Quality Program. These results represent standard cultivar development and nursery testing procedures and are presented here to facilitate deliberations and decisions as to the advancement or release of experimental germplasm. They may be freely used with permission from the authors.

Nurseries and the corresponding WAS (Wheat Analysis System) nursery numbers/codings are listed in Table 1. Experimental breeding lines are evaluated by comparison to check varieties grown in the same nursery (same location-year) to minimize environmental confounding. Check varieties and their occurrence in various nurseries are listed in Table 2. Due to practical limitations, a limited number of check varieties is used in this analysis. The inclusion of specific check varieties in nurseries is at the discretion of the breeder or Variety Testing coordinator; checks should reflect market class, current production, and be well-characterized for all aspects of end-use quality. Statistical analyses are conducted as essentially two-tailed paired *t*-tests using balanced designs. The number of paired comparisons, *n*, varies according to the check variety and trait. Tables 3 presents the Analysis of Variance by check variety for each quality parameter. Statistical significance is assigned at *P* ≤ 0.05; LSDs assume an  $\alpha = 0.05$ . A list of trait abbreviations follows. Table 4 tabulates all of the data used for this analysis.

<u>Trait abbreviation</u>	<u>Trait name</u>	<u>Units</u>	<u>Comments</u>
TWT	Test weight	lbs/bu	limits set for U.S. grades
WPROT	Wheat Protein	%	--
SKHRD	Single Kernel Hardness	unitless	--

CODI	Cookie Diameter	cm	--
CAVOL	Sponge Cake Volume	cc	--
LDOPA	L-DOPA	A <sub>475</sub>	polyphenol oxidase

### INTERPRETIVE SUMMARY FOR Xerpha

(As compared to Eltan, Finch, Madsen, Stephens and Tubbs06)

**Test weight** is similar to Eltan, Madsen, Stephens and Tubbs06; less than Finch (0.9 lbs/bu).

**Grain protein** is less than Madsen (0.5%) and Stephens (0.4%); similar to Eltan, Finch and Tubbs06.

**SKCS kernel hardness** is similar to Madsen and Tubbs06; somewhat greater than Eltan, Finch and Stephens.

**Kernel weight** is greater than Eltan, Finch and Madsen; less than Stephens and Tubbs06.

**Flour yield** is less than Finch (1.4%), Madsen (0.7%), Stephens (0.7%) and Tubbs06 (0.7%); similar to Eltan.

**Break flour yield** is less than Eltan, Finch and Madsen; similar to Stephens and Tubbs06.

**Flour ash** is less than Finch and Madsen; similar to Eltan, Stephens and Tubbs06.

**Milling Score** is similar to Eltan, Finch, Madsen and tubbs06; less than Stephens.

**Flour protein** is less than Madsen (0.7%) and Stephens (0.5%); similar to Eltan, Finch and Tubbs06.

**Flour Swelling Volume** indicates normal starch amylase.

**Dough water absorption** is similar to Eltan, Finch, Madsen and Tubbs06; greater than Stephens.

**Cookie diameter** is similar to slightly less than all checks.

**Sponge Cake Volume** is similar to Madsen and Stephens; less than Eltan and Finch.

**L-DOPA** indicates that PPO activity is higher than all the checks.

## CONCLUSION

**Xerpha** displays acceptable grain, milling and end-use quality, essentially equivalent to the quality of established varieties. Current release status is unknown but should be justified on non-quality considerations.

Overall, release of this variety is expected to:

- increase the overall quality of the wheat crop in Washington
- falls within the range of currently acceptable varieties and therefore should not have any particular effect on the overall quality of the wheat crop in Washington
- have both positive and negative effects on the overall quality of the wheat crop in Washington
- have both neutral and negative effects.
- decrease the overall quality of the wheat crop in Washington
- depend upon the variety that it will replace/supplant, meaning that its effect could be any one or a combination of the outcomes above
- require special handling, segregation, etc. for the following reason(s):

## ACKNOWLEDGMENTS

The dedicated efforts of the following staff of the Western Wheat Quality Lab and Wheat Quality Program are gratefully acknowledged: Mary L. Baldridge, Tracy Harris, Gail Jacobson, Bozena Paszczynska, William J. Kelley, Pat K. Boyer, Eric Wegner, Shawna Vogl and Renee Engle (ret.). Special thanks to John Burns (ret.) and the WSU Cereal Variety Testing Program for providing many of the samples analyzed herein.

Xerpha (WA007973) is a selection from a cross of Eltan and Estica made in 1999. A greenhouse breeding technique called single-seed descent was used to rapidly advance this line in the greenhouse to its fifth generation in just two years. Subsequent field selection was based on yield, test weight, disease resistance and general agronomics.

Xerpha is unique in that it has a very broad range of adaptation. It has been the top yielding variety in every precipitation zone for 2006 and 2007 in the WSU Extension Cereal Variety Testing Program where it was compared with 50 other varieties, breeding lines, and varietal blends from 10 other programs at 19 locations. It also has performed extremely well in 2007 N. California, S. Idaho, and Oregon Variety Testing Programs.

Xerpha is named in honor of Xerpha Gaines, WSU botanist.

#### Seed Availability

The Washington State Crop Improvement Association will have foundation seed available for commercial application beginning in the fall of 2008.

Application for U.S. Plant Variety Protection for Xerpha will be submitted. All seed requests should be sent to the breeder during the period of Protection by the Plant Variety Protection Certificate. Seed of this release is deposited in the National Plant Germplasm system where it will be available after the expiry of the Plant Variety Protection for research purposes, including development and commercialization of new cultivars. It is requested that appropriate recognition be made if this germplasm contributes to the development of new germplasm or cultivars.

PULLMAN, WASHINGTON  
IS PROUD TO ANNOUNCE THE  
RELEASE OF  
**XERPHA**  
Soft White Winter Wheat

## Xerpha

Xerpha is a soft white winter wheat highly adapted to a broad range of production zones in the Pacific Northwest. Outstanding characteristics of Xerpha are high grain yield, excellent test weight, cold tolerance and disease resistance.

### Description

Xerpha is a semi dwarf, soft white winter wheat with mid-season maturity, common head type, awned, with white straw and white chaff.

### Grain Yield

2006-2007 Yield as a % of Madsen

## Disease Reactions

Disease	Xerpha	Madsen	Eltan	Tubbs
Common Bunt	--	R	MR	R
Dwarf Bunt	MR	MR	MR	S
Flag Smut	--	MS	MS	--
Leaf Rust	--	MR	S	MS
Stripe Rust	MR	R	MR	MS
Stem Rust	--	R	S	--
Ceph. Stripe tolerance	5	5	6	1
Straw-breaker	T	R	S	R
Foot rot				
Snow mold	MR	S	MR	MR

\*VS = Very Susceptible; MS = Moderately susceptible; MR = Moderately Resistant; R = Resistant, T = Tolerant; 1 = poor, 5 = medium, 10 = excellent

## Quality

Xerpha displays good grain milling and end-use quality, essentially equivalent to established varieties.

USDA-ARS Wheat Genetics, Quality, Physiology and Disease Research Unit, Pullman, WA

Department of Crop and Soil Sciences

To Whom It May Concern:

Variance Statement for Xerpha Soft White Winter Wheat

Xerpha Soft White Winter Wheat may contain up to a total of 10 in one pound of seed of the following naturally occurring variant:

**Red Seed**

In addition to the above variant the following variants have been observed in Xerpha:

Height variation (2" – 8" taller) may occur at a rate of 1/10,000. Height variation will be more noticeable under higher yield environments.

Awnless heads; and club type heads may occur at a rate of 1/ 80,000 for heads combined, that are otherwise typical for this variety

These variants described are distinct within the variety and are stable and predictable with a degree of reliability comparable to other varieties of the same kind, and within recognized tolerances, when the variety is reproduced or reconstructed and was originally part of the variety when released.
