Exp. # F9N12-0151 Hard Red Spring Wheat

F9N12-0151 is a common hard red spring wheat adapted to the Northern Plains, including parts of Montana, North and South Dakota, and Minnesota. F9N12-0151 was developed by WestBred, from the cross "CA907-827/GLENN".

F9N12-0151 is a semi-dwarf hard red spring wheat. The head is strap shaped, lax, awned and inclined at maturity. The chaff color is white at maturity. The glume shoulders are oblique with an acuminate beak. The seed is hard, red, and oval with rounded cheeks. The brush is short with no collar.

A variant similar to F9N12-0151 but is 10-15 cm taller occurs at a frequency of .2% (20 plants per 10,000). A white seed variant may occur at a frequency of up to .25% (25 seeds per 10,000). An awnless variant may occur at a frequency of .1% (10 plants per 10,000). A bronze chaff variant may occur at a frequency of .1% (10/10,000). Otherwise, this variety has been uniform and stable in appearance and performance across several generations (F6 –F9) and environments.
